For over a century, our team of skilled foresters have partnered with landowners and land managers of Longleaf and Slash pine forest tracts across the coastal southeastern U.S. to harvest stumps. This partnership with Pinova is grounded in a shared love and stewardship for the land and a shared respect for pine forests.

Stump harvesting defrays site prep costs, encourages natural reforestation, improves the productivity of the land and removes fuel from the forest floor during prescribed burns.

Pinova seeks stumps from Longleaf or Slash pine trees that are 40+ years old which have been cut recently or years earlier.

The natural rosin from these stumps provides the foundation for a broad range of high performance specialty resins that are used in consumer and industrial applications in some of the world's best known brands.
